Text:
Explantion of Column Headings
Channel: This is the memory block within the ECV into which a specific coins programming information is stored. NOTE: If Medium or high security channels are programmed the same coin will be programmed on more than one channel I.E. Canadian $\$ 1.00$ Standard security on
Channel 1, High security $\$ 1.00$ Canadian coin on channel 4.
Currency (Country): This would be the country for which the currency programmed would be programmed I.E. Canada, US, Euro. (Multiple countries may be programmed on one validator.
Value (denomination): Coin value or type of token
Sorting (no, R,1,2,3): If sorting required which sort output to be made active.
Number (1...255): If multipulse number of pulses required for that coin.
